NAME

opendir − open a directory / readdir − read a directory

SYNOPSIS

#include <sys/types.h>

#include <dirent.h>

DIR *opendir(const char ***name*);**

struct dirent *readdir(DIR ***dir*);**

DESCRIPTION opendir

The **opendir()** function opens a directory stream corresponding to the directory *name*, and returns a pointer to the directory stream. The stream is positioned at the first entry in the directory.

RETURN VALUE

The **opendir()** function returns a pointer to the directory stream or NULL if an error occurred.

DESCRIPTION readdir

The **readdir()** function returns a pointer to a dirent structure representing the next directory entry in the directory stream pointed to by *dir*. It returns NULL on reaching the end-of-file or if an error occurred.

The data returned by **readdir()** is overwritten by subsequent calls to **readdir()** for the same directory stream.

The *dirent* structure is defined as follows:

```
struct dirent {
    long           d_ino;              /* inode number */
    off_t          d_off;              /* offset to the next dirent */
    unsigned short d_reclen;           /* length of this record */
    unsigned char  d_type;        /* type of file */
    char           d_name[256];   /* filename */
};
```

RETURN VALUE

The **readdir()** function returns a pointer to a dirent structure, or NULL if an error occurs or end-of-file is reached.

ERRORS

EACCES
Permission denied.

EMFILE
Too many file descriptors in use by process.

ENFILE
Too many files are currently open in the system.

ENOENT
Directory does not exist, or *name* is an empty string.

ENOMEM
Insufficient memory to complete the operation.

ENOTDIR
name is not a directory.

NAME

stat, lstat − get file status

SYNOPSIS

#include <sys/types.h>
#include <sys/stat.h>
#include <unistd.h>

int stat(const char * *file_name***, struct stat ***buf***);**
int lstat(const char * *file_name***, struct stat ***buf***);**

DESCRIPTION

These functions return information about the specified file. You do not need any access rights to the file to get this information but you need search rights to all directories named in the path leading to the file.

stat stats the file pointed to by *file_name* and fills in *buf*.

lstat is identical to **stat**, except in the case of a symbolic link, where the link itself is stat-ed, not the file that it refers to.

They all return a *stat* structure, which contains the following fields:

```
struct stat {
    dev_t      st_dev;     /* device */
    ino_t      st_ino;     /* inode */
    mode_t     st_mode;    /* protection */
    nlink_t    st_nlink;   /* number of hard links */
    uid_t      st_uid;     /* user ID of owner */
    gid_t      st_gid;     /* group ID of owner */
    dev_t      st_rdev;    /* device type (if inode device) */
    off_t      st_size;    /* total size, in bytes */
    blksize_t  st_blksize; /* blocksize for filesystem I/O */
    blkcnt_t   st_blocks;  /* number of blocks allocated */
    time_t     st_atime;   /* time of last access */
    time_t     st_mtime;   /* time of last modification */
    time_t     st_ctime;   /* time of last status change */
};
```

The value *st_size* gives the size of the file (if it is a regular file or a symlink) in bytes. The size of a symlink is the length of the pathname it contains, without trailing NUL.

The following POSIX macros are defined to check the file type:

S_ISREG(m)	is it a regular file?
S_ISDIR(m)	directory?

RETURN VALUE

On success, zero is returned. On error, −1 is returned, and *errno* is set appropriately.
